Trackr — what to do later

Written 18 Oct 2026, after the overnight run. Tick the boxes as you go. Steps marked **Must** come first.

Where things stand now

Everything from the overnight run (forecast, rules, returns, X-ray, notifications, broker editing, new navigation and the rest) is merged into `main` **on your Mac only**. It is tested: 37 unit tests and 72 browser tests pass. It is **not on GitHub yet**, so the live app still runs yesterday's version. Nothing is lost while you wait.

1 Let GitHub accept the push Must

Why: the update includes automatic test runs for GitHub (files in `.github/workflows/`). GitHub only accepts those from a login that has the **workflow** permission, and the one saved on your Mac doesn't. So GitHub refused the whole push.

Pick **one** of these three:

	Option	How

☐	**A. Install GitHub's tool** (recommended)	In Terminal, one line at a time:
		`brew install gh`
		`gh auth login`
		`gh auth setup-git`
		Choose GitHub.com, HTTPS, and "Login with a web browser". This login includes the workflow permission, and it lets Claude open pull requests for you next time.

☐	**B. Edit your token**	On github.com: your photo → Settings → Developer settings → Personal access tokens. Open the token this Mac uses and tick **workflow** (for a fine-grained token: Repository permissions → **Workflows: Read and write**). Save.
☐	**C. Push without the test runs**	Tell Claude **"push without CI"** and approve when Claude Code asks to rewrite the unpushed commits. Everything goes live except the automatic test runs, which wait switched off in `docs/integrations/github-workflows/`.

☐ Then tell Claude: **"push"**.

2 Check the live app after the push Must

1. ☐ Wait about 2 minutes, then open the app on your phone.
2. ☐ Close it and open it again (the app updates itself on the second start).
3. ☐ Check that your numbers look the same as before, and that the loan is still not in your net worth.
4. ☐ Open Budget: there is now a **Forecast** tab. If you see it, the update worked.

If something looks wrong, tell Claude what you see. The previous version is one command away.

3 Replace your Twelve Data key Must

Why: your key for live stock prices is written in the public code (`app.js`), so anyone could use it up. It was already there before the overnight run.

1. ☐ Tell Claude: **"remove the Twelve Data key from the code"**. The app will then read the key from Settings only.
2. ☐ Sign in on twelvedata.com and create a new key. Then delete (revoke) the old one.
3. ☐ Paste the new key yourself in the app: Settings → Display → Twelve Data API key. Never paste it into the chat.

4 Decide about your loan figures Soon

Why: `loan.js` holds your real loan amounts, and the repository is public.

- ☐ **Option 1:** tell Claude **"move my loan figures out of the code"**. They move into your own synced data, and the code only keeps the calculation. Old versions stay in GitHub's history.
- ☐ **Option 2:** make the repository private as well. GitHub Pages on a private repository needs a paid GitHub plan.

5 Try the new things and switch on what you like Soon

	Where	What it does
☐	Budget → Forecast	Your balance for the next 30/90/365 days, the lowest point, and "what if" scenarios.
☐	Budget → Categories → Rules	"If the name contains X, put it in Y". Add 3–5 rules for your usual shops.
☐	Analysis → Returns / X-ray	Real performance, and 9 health checks. Snooze or switch off the ones you don't care about.
☐	Bell icon → Notifications	All alerts in one list. You can download calendar reminders there.
☐	Any broker page → Edit	Rename or edit a broker or exchange.
☐	Cmd+K (on a computer)	Jump to any page or holding.
☐	Settings → Display	Switches, all off by default: **Category budgets**, **Update holdings when I record a trade**, **Dutch box 3 estimate**, **New navigation**.
☐	Settings → Backup & Restore	**Emergency pack**: a printable summary and a passphrase-locked backup for family.

6 Optional set-ups Optional

- ☐ **Apple Pay → Trackr.** An iPhone Shortcut that opens Trackr pre-filled after each Apple Pay payment. Instructions: `docs/apple-pay-shortcut.md`. Note: it may open in Safari rather than the Home Screen app.
- ☐ **Daily snapshot on the server**, so history has no gaps on days you don't open the app. Read `docs/integrations/server-snapshot/README.md` first. You run the SQL yourself in Supabase; Claude never touches your database.
- ☐ **Encrypted nightly backup to your private repo**: `docs/integrations/nightly-backup-to-private-repo.yml`. It needs secrets that you add yourself in GitHub settings.
- ☐ Close the stuck **Microsoft Excel** window a research helper opened during the night. Nothing was saved in it.

7 Features still to build (ask Claude when you want them)

	Feature	What you'd get
☐	Historical exchange rates	Old USD/GBP/CHF transactions converted at the rate of their own day, not today's.
☐	Recurring transfers	"€200 into a pocket every month" as a recurring item.
☐	Recurring calendar states	Paid / paid a different amount / missed, for each bill.
☐	"To review" list	Transactions whose category the app guessed with low confidence.
☐	Goal photos in the Mac's daily backup	Photos included in your daily Excel backup too (needs you present: it uses your real Supabase).
☐	Server snapshots, app side	The app fills history gaps from the server (after the optional set-up in step 6).
☐	Year in review	Swipeable cards summarising your year.
☐	Age of Money · "next €250" planner	How long money sits before you spend it; where new money should go to reach your target mix.

8 Tidy up at the end Optional

- ☐ Once everything is live and fine, Claude can delete the local branches `overnight/2026-10-18` and `overnight/navigation`; everything they hold is in `main`.
- ☐ The full overnight notes stay in `docs/overnight/`: REPORT, PLAN, RESEARCH, BACKLOG, DECISIONS and before/after screenshots.
